

The study of invented institutions has long asked why cooperation persists in the absence of central enforcement. This essay revisits that question with a simple model of repeated exchange. Actors who expect to meet again discount the future less heavily, and the shadow of that future disciplines present behaviour. The columns of this page are set separately, and an extractor that reads straight across the page will interleave them into nonsense.

The study of invented institutions has long asked why cooperation persists in the absence of central enforcement. This essay revisits that question with a simple model of repeated exchange. Actors who expect to meet again discount the future less heavily, and the shadow of that future disciplines present behaviour. The columns of this page are set separately, and an extractor that reads straight across the page will interleave them into nonsense.

Critics reply that repetition alone cannot carry the weight placed on it. Institutions, on this view, matter because they change what actors believe about one another rather than what they earn from one another. The disagreement is partly empirical and partly about what counts as an explanation. The second column continues the argument to give the column detector enough text on each side of the page to measure.
